

Curtis Pritchard

Software Developer

Key Points

AI-Assisted Development

Development with the assistance of an AI streamlines the development process. This also helps to find issues before they appear in the first place.

Mobile Applications Developer

5 Years of experience With both native and hybrid application development. This includes the Carplay and Android Auto!

Intellectual Transport Systems Developer

2 Years of experience with ITS development. Working to deliver public safety messages, directly to your phone!

DIY Microcontroller Projects

A Developer should not stop at software experiences. Knowing both sides of a project is really important to me.

Experienced Languages

- Flutter
- Vue
- Android Dev
- Java
- Laravel
- C#
- Node Js
- Python
- Angular Js
- Swift
- React

Professional Summary

Versatile Web & Mobile Applications Developer with 5+ years of experience in native and hybrid mobile development, frontend software development, and AI-assisted workflows. I delivered high-impact, scalable solutions at Taplane and Gambit Ventures within 2 years, ranging from commercial V2X automotive communication apps to modernized geospatial traffic analytics platforms. Skilled in Flutter, Vue.js, Laravel, and C#, with a strong background in real-time data processing and responsive UI design. Passionate about bridging software and hardware through DIY microcontroller projects and mentoring the next generation of developers.

WORK EXPERIENCE

Taplane (Full Stack Developer)

full-time | January 2022 - Present

Year 3 & 4 — Cross-Platform Developer, Internal LMS, Live Transit Mapping & V2xConnect
(Flutter, J2735/ASN.1, Denso/Commsignia Devices)

- Developed the V2xConnect mobile app, certified under OmniAir standards, to collect and replay J2735 V2X communications from Denso/Commsignia hardware devices.
- Built a 'video-style' playback engine converting raw PCAP network data into a human-readable chronological experience for improved V2X vetting and analysis, reducing data review time by 30-40%.
- Led the engineering of a geospatial traffic analytics platform, modernizing legacy systems into performant, map-centric reporting products using Vue and Laravel.
- Optimized real-time congestion data rendering across large networks by implementing selective geospatial segment loading to prevent UI performance degradation.

Year 2 — Front-End Developer, Vantage Argus (Iteris)
(Vue, Laravel, Postgres, Leaflet/Mapbox)

- Prototyped live-transit mapping and internal LMS tools while deepening expertise in J2735 standards, ASN.1 structures, and complex real-time data visualization.

Year 1 — Software Developer, Reward & Logo Apps
(Android Java, AngularJS, Laravel)

- Re-architected core application engine for multiple consumer-facing reward and playtime apps, transitioning from static, hard-coded behavior to a dynamic, server-driven configuration model.
- Enabled real-time toggling of core features (authentication providers, rewards, playtime bonuses, daily check-ins, account flagging) without requiring App Store updates, significantly increasing release agility and reducing operational downtime.
- Established a scalable white-label templating model, allowing new app variants to be produced using backend feature toggles and theme overrides rather than full-cycle builds, accelerating product delivery by 50% and reducing maintenance costs by 20%.
- Improved application resilience by ensuring failures in third-party login (e.g., Facebook/Google outages) did not invalidate user access or halt revenue flow.

Gambit Ventures Ltd. — Frontend Developer

Full-Time | July 2021 – January 2022

(Angular, WordPress, HTML/CSS/JS, Responsive UI)

- Developed and maintained a suite of single-page applications and reusable, responsive UI components using a mobile-first approach, increasing development speed by 25% within 7 months.
- Modernized legacy web applications and executed UX alignment work to bring older products up to current industry performance and accessibility standards.
- Translated complex product requirements into functional front-end implementations while maintaining and expanding internal web tooling and public websites.

Code Ninjas — Developer Mentor

Part-Time | January – May 2021

- Mentored students in JavaScript, C#, Lua, and Python, delivering structured instruction on programming concepts and game-development fundamentals.
- Supported student debugging and project work with real-time demonstrations of advanced concepts like OOP and state management to foster curiosity and mastery.

VOLUNTEERING

First Robotics

Tecumseh Vista January 2019 – 2021, River Rouge 2023 - 2024

- Co-Owner of River Rouge Robotics
- Mentor for students wanting to learn the basics of Java through First Robotics

- Pursuing these students' creativity, by applying what we learned in robotics in their own life. Learning HTML and Lua
 - Above all else, First Robotics was a place to allow students to explore new ideas
 - Safety of our students was our first priority. We promoted user safety by adhering to a set of workspace rules, and assuring that mentors were always at the ready when working with power tools. This includes safety precautions while working with a live robot.
-

EDUCATION

St. Clair College — Mobile Applications Development, Diploma

Graduated December 2020

- Completed comprehensive training in mobile and web software development across iOS, Android, and full-stack web platforms.
- Gained hands-on experience with native app development, backend service integration, REST APIs, UX/UI fundamentals, unit testing, and Agile project workflows.
- Developed multiple applications through project-based coursework, applying object-oriented design, software architecture principles, and collaborative development practices.
- Served as Secretary of the Mobile Applications Development Club (2019), coordinating student events and helping peers stay engaged with emerging tech.
- Actively remained current with industry tools and trends through workshops, speaker events, and community programming initiatives.
